DROPE PRESS – TONA PEČKY factory

Metall-ceramic based materials and organic based materials are applied by the following forms:

1. **Riveting** - we provide it by special pneu-hydromatical presses with regulated pressure and uprise including the pressure progress during the riveting process as well, thank to that there is achieved optimal strenght of the rivet torque as well.

2. **Sticking** - by the usage of a special glue hardened in very high temperatures. There is a strong focus on keeping all technologies including blast cleaning and surfaces grease removal during the preparation of the surface for sticking. The stucked link hardening is leaded by a regulated proces in the high volume oven in the accordance with high strenghtness of the stucked link assurance, which is then followed by a check in.

3. **Pressuring** - the friction material is directly pressed on back plates materials by very high pressure under high temperatures, mainly in specialized forms and tools.

4. **By inputing in heap** - strictly machined segments or plates are given into metall heaps, mainly directly at customers facilities during the reparations of machineries as well.

Technical data sheets of used materials for each applications and kind of usage (dry or wet running) are a invisible part of a supply.
